	Story 5.2	Configure Monitoring Rules	Medium	3

A burndown chart shows the amount of work remaining in a sprint over time. The ideal guideline represents the expected rate of progress, while the actual progress line shows how quickly the team completes planned work. In the Microservice Catalog & Health Portal (MCHP) project, the burndown chart was used to monitor the completion of user stories

related to service catalog management, dependency visualization, API documentation aggregation, health monitoring, and system administration. A downward trend in the chart indicates that sprint work is being completed and the remaining workload is decreasing as planned.

1. What went well?

The core functionalities of the Microservice Catalog & Health Portal were prioritized and planned effectively. User stories were organized based on project importance, and story points were assigned using Agile estimation techniques. The sprint structure helped maintain a clear development roadmap and track progress efficiently.

2. What was challenging?

Features such as dependency visualization, health monitoring, and service availability tracking were relatively complex because they required analyzing relationships between multiple microservices and handling monitoring logic, alert generation, and performance metrics.

3. What did the burndown chart show?

The burndown chart showed a gradual reduction in the remaining workload as stories progressed through the workflow stages from **To Do** to **In Progress** and finally **Done**. This indicated steady sprint progress and completion of planned work items.

4. What could be improved?

Future sprints could benefit from more accurate effort estimation based on the team's observed velocity. Additional refinement of user stories before sprint planning could also help improve workload distribution and sprint predictability.

5. What was learned?

The project demonstrated how a software system can be decomposed into Agile Epics and User Stories, prioritized according to business value, estimated using Story Points, organized into Sprints, and monitored through Scrum practices such as sprint boards and burndown charts. It also provided practical experience in Agile project planning and progress tracking.
